Comparison of Image Quality of A-2 and B Configurations

1. It is the general opinion of the photographic evaluation group that on the 1700 series the A-2 configuration has been furnishing more intelligence information than the B configuration. This opinion is based on apparent resolution and suitability for photo interpretation. It is further felt, that to some degree, both resolution and P.I. quality is degenerated by the mechanical malfunctions that have accompanied the B configuration on practically all missions.
